Introduction

Unified Endpoint Management (UEM) — a system that centralizes the control, security, and monitoring of all company devices — has become essential as modern retail, F&B, and SMB businesses scale across multiple locations. With growing fleets of Android POS systems, kiosks, and tablets, UEM helps companies maintain consistent configurations, reduce downtime, strengthen security, and enable efficient remote support. These capabilities are increasingly critical as organizations seek to minimize operational disruptions and ensure reliable customer-facing technology.

KiwiCloud, developed in partnership with iMin Technology, provides a cloud-native UEM platform optimized for Android commercial devices. Pre-installed on iMin hardware, KiwiCloud enables "ready on day one" deployment with zero-touch provisioning, quick policy enforcement, remote troubleshooting, and flexible device control through Google-Managed Access (GMA) or KiwiCloud-Managed Access (KMA). This integration positions KiwiCloud as an accessible, scalable, and SMB-friendly UEM solution that bridges the gap between overly complex enterprise systems and overly simple SMB tools.

Our project supports the creation and development of KiwiCloud Academy — an internal training ecosystem designed to standardize staff knowledge, enhance product fluency, and equip new team members with the skills needed to understand the UEM landscape and confidently communicate KiwiCloud's value. The Academy provides structured modules, quizzes, case studies, and visual learning tools to strengthen onboarding and long-term learning.

iMin

Deliverables

Goal: Aid KiwiCloud in content development through research for their employee training platform, KiwiCloud Academy. We focused and delivered content for 3 pillars of the Academy, which are stated below:

- **Industry Context**
  - Industry research pack
  - Lecture deck
  - Quiz
- **Product Knowledge**
  - GMA & KMA case studies
  - Quiz
- **Selling KiwiCloud**
  - Methods research and recommendations

Industry Context

01 Market Size & Growth

The global UEM market is about $4B (2023) and is projected to reach $30B+ by 2031. Growth is driven by hybrid work, cybersecurity risks, cloud adoption, and the rising number of devices like POS, tablets, and mobile endpoints. North America leads with about 40% of global revenue due to faster tech adoption and stricter security standards.

02 U.S. Market Leadership

The U.S. market alone is expected to hit $2.2B by 2025, with strong adoption in finance, healthcare, retail, F&B, and tech. U.S. vendors such as Microsoft, VMware, and IBM set global expectations for automation, security, and AI-driven device management. This makes the U.S. the benchmark market for UEM innovation.

03 Competitive Landscape & Gap

Because public data is limited, we relied on trusted analyst reports like IDC MarketScape. The market splits into enterprise leaders (powerful but complex), specialists (strong in specific device types), and SMB tools (simple but limited). This reveals a clear gap between enterprise depth and SMB simplicity, creating an opportunity for an Android/POS-focused, cloud-native solution like KiwiCloud.

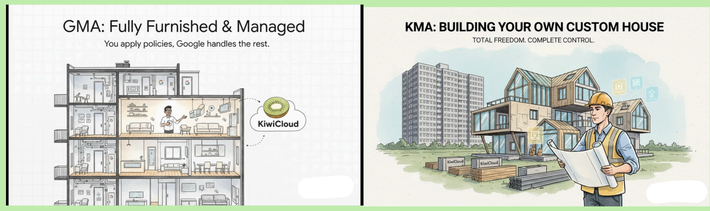
Product Knowledge

Policies & Security
Lock devices with Kiosk Mode, hardware controls, and Lost Mode.
automated actions with geofencing when devices move in or out of defined areas.

Remote Support
Remotely view/control devices, chat with users, and transfer files.
Track both real-time and historical device locations.

t

Product Knowledge: Continued



GMA (Google Managed Access) is like moving into a fully built apartment. The building is already complete. Google has the structure, utilities, and core services in place. As the renter, all you need to do is choose the furniture, such as custom touches, and policies you want on your device.

KMA (KiwiCloud Managed Access) is like designing and building your own house from the ground up. You control everything. The layout, the materials, the look and feel, and even how the "app store" and services are structured. It's full customization with no preset limits.

How to sell KiwiCloud

1. Identify Customer Pain Points
Highlight issues like inconsistent device setups, slow updates, high ticket volume, costly on-site support, and limited IT bandwidth across stores.

2. Connect Their Needs to KiwiCloud
Explain how KiwiCloud solves these pains through zero-touch provisioning, remote troubleshooting, centralized policy control, POS/kiosk lockdown, and fast app pushes — without the complexity of enterprise UEMs.

3. Prove Real Impact
Share clear outcomes:
- Setup time reduced from days → under 1 hour
- 20–40% fewer IT tickets
- Lower support costs & fewer site visits
- 260–440% ROI (based on industry UEM studies)

Core Message:
KiwiCloud is a simple, powerful, and affordable UEM solution built for Android retail devices and iMin hardware, delivering enterprise results with SMB-friendly ease.

DEPAUW UNIVERSITY

Acknowledgements

A special thanks to Professor Yang and the entire Depauw Business Analystics Deparment for making this opportunity possible. As well as Professor Amirpour from UT Dallas for providing our team with guidance in sales strategies. We also finally want to thank KiwiCLoud for their willing and active collaboration with our team throughout the semester.
